

Salamanca hosts the fourth General Assembly of the international dAIEDGE project

Este consorcio reúne a 36 entidades procedentes de 15 países con la Universidad de Salamanca y el AIR Institute como socios clave

Today and tomorrow, the city of Salamanca will become the European headquarters of technological innovation with the celebration of the fourth General Assembly of the dAIEDGE project. This project brings together a consortium of 36 entities from 15 countries, including universities, research centres, technology companies and associations, which are collaborating with a common goal: to propel Europe towards a position of leadership in artificial intelligence at the Edge, strengthening technological innovation, digital sovereignty and the transition to a more competitive and sustainable economy.

Through innovation in next-generation artificial intelligence, dAIEDGE provides a virtual Edge AI laboratory and organises collaborative workshops that foster cooperation between experts and companies. The project has now opened its third and final call for funding, which will remain open until 14 October. In this edition, 10 projects will be selected, each

receiving up to €60,000 and seven months of joint work with specialists from the German Research Centre for AI. The call is aimed at legal entities, either individually or in consortia of up to two members, including universities, SMEs and start-ups.

The Assembly is taking place at the Colegio Arzobispo Fonseca of the University of Salamanca, a historic space that is the best possible setting for an event of this nature. Both the University of Salamanca and the AIR Institute are acting as hosts and key partners in the project, highlighting the city's ability to attract initiatives with enormous international impact. The choice of Salamanca as the venue is no coincidence, but rather recognition by the consortium of the growing role that both the academic institution and the local research ecosystem are playing in the field of technological innovation and digitalisation at an international level.

Throughout these sessions, the members of the consortium will jointly analyse the progress made, share experiences and discuss the next steps needed to strengthen the continent's technological competitiveness. Likewise, the focus will continue to be on creating a dynamic and sustainable European ecosystem that allows cutting-edge artificial intelligence to become an engine of economic growth and social transformation.

Salamanca's role as a technological meeting point will be further consolidated on Wednesday 17 September with the celebration of International Cooperation Day, an event that promotes international collaboration between experts, universities and leading institutions, in which dAIEDGE will be represented by the University of Salamanca.
